ART UNIT 2617		PAPER NUMBER		
NOTIFICATION DATE 03/21/2011		DELIVERY MODE ELECTRONIC		

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

us-docketing@qualcomm.com

Office Action Summary

Application No.

10/774,561

Applicant(s)

PARK ET AL.

Examiner

WILLIE J. DANIEL JR

Art Unit

2617

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 14 February 2011.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 58-85,87-96,98-105 and 107-119 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 58-85,87-96,98-105 and 107-119 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-946)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB/08)
Paper No(s)/Mail Date _____
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

1. This action is in response to applicant's amendment filed on 14 February 2011. **Claims 58-63, 65-74, 76-85, 87-96, 98-105, and 107-119** are now pending in the present application and **claims 1-57, 64, 75, 86, 97, and 106** are canceled. This office action is made **Non-Final**.

Continued Examination Under 37 CFR 1.114

2. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 14 February 2011 has been entered.

Claim Objections

3. **Claims 59 and 62** are objected to because of the following informalities:
 - a. Claim 59 recites the limitation "...requirements **detemli** nation module..." in line(s) 5 of the claim. The Examiner interprets as --requirements **determination** module-- and suggests replacing said limitation to help clarify the claim language.
 - b. Claim 62 recites the limitation "...information is. ..." in line(s) 2 of the claim. The Examiner requests that the punctuation mark -- . -- be deleted and suggests replacing the limitation with --information is-- to help clarify the claim language.

Appropriate correction is required.

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 58-59, 62-63, 66-68, 70, 73-74, 77-79, 81, 84-85, 88-90, 92, 95-96, 99-101, 103-104, and 108-118 are rejected under 35 U.S.C. 103(a) as being unpatentable over **Sanmugam (US 5,533,094)** in view of **Miah et al.** (hereinafter Miah) (**EP 1217855 A1**).

Regarding **claim 58**, Sanmugam discloses a system for distributed packet-based paging { (see col. 4, line 56 - col. 5, line 45; Figs. 1 & 9) }, comprising:

a plurality of access nodes (e.g., BS 256) configured to provide paging messages { (see col. 4, line 56 - col. 5, line 45; col. 6, lines 22-25; abstract; Figs. 1 & 9), where the system provides pages to a mobile station (M1) },

each of the access nodes (e.g., BS 256) comprising a paging requirements determination module (e.g., BS 256) and a paging resource control module (e.g., BS 256) (see col. 13, lines 1-32; col. 7, lines 8-15; col. 8, line 1-9; col. 9, line 2; Figs. 9 & 8A-B), where page requests are based on paging information such as class of service, paging parameters, paging field, paging characteristics, and paging extent,

wherein each paging requirements determination module is configured to receive and analyze paging information to determine a level of quality of service (e.g., class of service or priority) for a corresponding paging message (e.g., page requests) { (see col. 5, lines 40-45; col. 4, line 66 - col. 5, line 13; col. 13, lines 1-32; col. 7, lines 8-15; col. 8, line 1-9; col. 9,

line 2; Figs. 9, 1, 8A-B), where page requests are based on paging information such as class of service, paging parameters, paging field, paging characteristics, and paging extent. In addition, paging orders are transmitted towards the base station (e.g., 256) and places the page message(s) in buffers of the base stations in which the page message(s) are transmitted according to paging priorities (see col. 12, lines 29-40), where the base station (e.g., 256) determines what the paging priorities are in order to allocate resources to distribute the paging messages appropriately. }, and

wherein each paging resource control module is configured to allocate paging resources and generate the corresponding paging message in accordance with the level of quality of service (e.g., class of service or priority) determined by the paging requirements determination module { (see col. 5, lines 40-45; col. 10, lines 53-56; col. 13, lines 1-32; col. 7, lines 8-15; col. 8, line 1-9; Figs. 9, 1, 8A-B), where a base station provides allocates resources to a mobile station (M1) (see col. 4, line 64 - col. 5, line 13) and where paging orders are transmitted towards the base station (e.g., 256) and places the page message(s) in buffers of the base stations in which the page message(s) are transmitted according to paging priorities (see col. 12, lines 29-40; col. 8, line 45 - col. 9, line 4), where the base station (e.g., 256) determines what the paging priorities are in order to allocate resources to distribute the paging messages appropriately }. Sanmugam clearly discloses the features as indicated above as evidenced by the fact that one of ordinary skill in the art would clearly recognize. However, the examiner maintains that the feature(s) level of quality of service was well known in the art, as taught by Miah.

As further support in the same field of endeavor, Miah at the least discloses the feature(s) level of quality of service (e.g., an indicator of type or priority) (see col. [0012 or lines 12-23]), where communication is provided by a packet radio system exchanging data or paging signals and the radio access network reads the header (e.g., an indicator of type or priority) of a paging message to schedule or prioritize for transmitting to a mobile phone (2). In addition, Miah at the least further the feature(s) discloses a system for distributed packet-based paging, comprising: a plurality of access nodes (e.g., radio access network with RNC 12, node B 16, and transmitter/receiver 20) configured to exchange paging messages (see col. 1, [0007]; col. 2, [0015] - col. 3, [0017]), where the mobile station (2) is sent a paging message. }.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Sanmugam and Miah to have the feature(s) level of quality of service, in order to provide an improved RNC for scheduling or prioritizing paging messages, as taught by Miah (see col. 2, [0011; [0012 or lines 14-18]).

Regarding **claims 59, 70, 81, and 92**, Sanmugam discloses an access node for use in a system for distributed packet-based paging (see col. 4, line 56 - col. 5, line 45; Figs. 1 & 9), comprising:

a paging requirements determination module (e.g., BS 256); and a paging resource control module (e.g., BS 256) (see col. 13, lines 1-32; col. 7, lines 8-15; col. 8, line 1-9; col. 9, line 2; Figs. 9 & 8A-B), where page requests are based on paging information such as class of service, paging parameters, paging field, paging characteristics, and paging extent,

wherein the paging requirements determination module is configured to receive and analyze paging information to determine a level of quality of service (e.g., class of service or priority) for a corresponding paging message (e.g., page requests) { (see col. 5, lines 40-45; col. 4, line 66 - col. 5, line 13; col. 13, lines 1-32; col. 7, lines 8-15; col. 8, line 1-9; col. 9, line 2; Figs. 9, 1, 8A-B), where page requests are based on paging information such as class of service, paging parameters, paging field, paging characteristics, and paging extent. In addition, paging orders are transmitted towards the base station (e.g., 256) and places the page message(s) in buffers of the base stations in which the page message(s) are transmitted according to paging priorities (see col. 12, lines 29-40), where the base station (e.g., 256) determines what the paging priorities are in order to allocate resources to distribute the paging messages appropriately. },

wherein the paging resource control module is configured to allocate paging resources and generate the corresponding paging message in accordance with the level of quality of service (e.g., class of service or priority) determined by the paging requirements determination module { (see col. 5, lines 40-45; col. 10, lines 53-56; col. 13, lines 1-32; col. 7, lines 8-15; col. 8, line 1-9; Figs. 9, 1, 8A-B), where a base station provides allocates resources to a mobile station (M1) (see col. 4, line 64 - col. 5, line 13) and where paging orders are transmitted towards the base station (e.g., 256) and places the page message(s) in buffers of the base stations in which the page message(s) are transmitted according to paging priorities (see col. 12, lines 29-40; col. 8, line 45 - col. 9, line 4), where the base station (e.g., 256) determines what the paging priorities are in order to allocate resources to distribute the paging messages appropriately }. Sanmugam clearly discloses the features as indicated

above as evidenced by the fact that one of ordinary skill in the art would clearly recognize. However, the examiner maintains that the feature(s) level of quality of service was well known in the art, as taught by Miah.

As further support in the same field of endeavor, Miah at the least discloses the feature(s) level of quality of service (e.g., an indicator of type or priority) (see col. [0012 or lines 12-23]), where communication is provided by a packet radio system exchanging data or paging signals and the radio access network reads the header (e.g., an indicator of type or priority) of a paging message to schedule or prioritize for transmitting to a mobile phone (2). In addition, Miah at the least further the feature(s) discloses a system for distributed packet-based paging, comprising: a plurality of access nodes (e.g., radio access network with RNC 12, node B 16, and transmitter/receiver 20) configured to exchange paging messages (see col. 1, [0007]; col. 2, [0015] - col. 3, [0017]), where the mobile station (2) is sent a paging message. }.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Sanmugam and Miah to have the feature(s) level of quality of service, in order to provide an improved RNC for scheduling or prioritizing paging messages, as taught by Miah (see col. 2, [0011; [0012 or lines 14-18]).

Regarding **claims 62, 73, 84, and 95**, the combination of Sanmugam and Miah discloses every limitation claimed, as applied above (see claim 109), in addition Sanmugam further discloses the access node of claim 109, wherein the exchange of the paging information is based on an Internet protocol (IP) (see col. 13, lines 1-32; col. 7, lines 8-15; col. 8, line 1-9; col. 9, line 2; Figs. 9, 8A-B), where page requests are based on paging

information such as class of service, paging parameters, paging field, paging characteristics, and paging extent. As further support, Miah at the least discloses the feature(s) wherein the exchange of the paging information is based on an Internet protocol (IP) (see col. 1, [0002 or lines 13-16]; col. [0012 or lines 12-23]), where communication is provided by a packet radio system exchanging data or paging signals.

Regarding **claims 63, 74, 85, and 96**, the combination of Sanmugam and Miah discloses every limitation claimed, as applied above (see claim 62), in addition Sanmugam further discloses the access node of claim 62, wherein the paging requirements determination module is further configured to determine the level of quality of service (e.g., class of service or priority) based on matching IP datagrams to specific paging requirements (see col. 13, lines 1-32; col. 7, lines 8-15; col. 8, line 1-9; col. 9, line 2; Figs. 9, 8A-B), where page requests are based on paging information such as class of service, paging parameters, paging field, paging characteristics, and paging extent. As further support, Miah at the least discloses the feature(s) wherein the paging requirements determination module is further configured to determine the level of quality of service (e.g., an indicator of type or priority) based on matching IP datagrams to specific paging requirements (see col. 1, [0002 or lines 13-16]; col. [0012 or lines 12-23]), where communication is provided by a packet radio system exchanging data or paging signals.

Regarding **claims 66, 77, 88, and 99**, the combination of Sanmugam and Miah discloses every limitation claimed, as applied above (see claim 109), in addition Sanmugam further discloses the access node of claim 109, wherein the QoS (e.g., class of service or priority) is one of a plurality of levels (see col. 7, lines 8-15; col. 8, line 1-25,45-64; col. 9,

line 59-62,8-18; col. 13, lines 1-32; Figs. 9, 8A-B), where page requests are based on paging information such as class of service, paging parameters, paging field, paging characteristics, and paging extent.

Regarding **claims 67, 78, 89, 100, and 108**, the combination of Sanmugam and Miah discloses every limitation claimed, as applied above (see claim 109), in addition Sanmugam further discloses the access node of claim 109, wherein the QoS (e.g., class of service or priority) requires at least one of transmission of the page multiple times and retransmission of the page at least once in the absence of an acknowledgment (see col. 6, lines 22-40; col. 7, lines 8-15; col. 8, line 1-9; col. 9, line 2; col. 13, lines 1-32; Figs. 9, 8A-B), where page requests are based on paging information such as class of service, paging parameters, paging field, paging characteristics, and paging extent.

Regarding **claims 68, 79, 90, and 101**, the combination of Sanmugam and Miah discloses every limitation claimed, as applied above (see claim 109), in addition Sanmugam further discloses the access node of claim 109, wherein the determined level of quality of service comprises determining whether a plurality of paging requests are associated as a group with a common quality of service indicator (see col. 8, lines 24-30,1-9; col. 6, lines 24-26; col. 7, lines 8-15; col. 10, lines 32-34); and

the paging resource control functionality comprises allocating a fraction of paging channel capacity or paging transmission opportunities to the plurality of page requests associated with the group (see col. 8, lines 1-11,30-34; col. 7, lines 8-15; col. 10, lines 53-56; Figs. 9, 2-3).

Regarding **claims 103-104**, Sanmugam discloses an end node for use in a system for distributed packet-based paging (see col. 4, line 56 - col. 5, line 45; Figs. 1 & 9), comprising:

means for receiving a first page from a first access node (e.g., 256) comprising a first paging resource control module and a first paging requirements determination module (e.g., BS 256) { (see col. 13, lines 43-50; col. 6, lines 21-25) },

where the first paging resource control module is configured to allocate paging resources and generate the first page to the end node (e.g., M1) in accordance with a first level of quality of service (e.g., class of service or priority) determined based on paging information by the first paging requirements determination module { (see col. 5, lines 40-45; col. 6, lines 21-25; col. 10, lines 53-56; col. 13, lines 1-32; col. 7, lines 8-15; col. 8, line 1-9; Figs. 9, 1, 8A-B), where a base station provides allocates resources to a mobile station (M1) (see col. 4, line 64 - col. 5, line 13) and where paging orders are transmitted towards the base station (e.g., 256) and places the page message(s) in buffers of the base stations in which the page message(s) are transmitted according to paging priorities (see col. 12, lines 29-40; col. 8, line 45 - col. 9, line 4), where the base station (e.g., 256) determines what the paging priorities are in order to allocate resources to distribute the paging messages appropriately }; and

means for receiving a second page, different from the first page, from a second access node (e.g., 256) comprising a second paging resource control module and a first paging requirements determination module (e.g., BS 256), where the second paging resource control module is configured to allocate paging resources and generate the second page in accordance with a second level of quality of service determined based on the same paging information received by the second paging requirements determination module (see col. 5,

lines 19-27,51-57; col. 13, lines 43-50; col. 6, lines 21-25), where a mobile station can receive a message in a second cell (e.g., 256) after being hand-off to another cell (e.g., 256). Sanmugam inexplicitly discloses having the feature(s) means for receiving a second page, different from the first page, from a second access node comprising a second paging resource control module and a first paging requirements determination module, where the second paging resource control module is configured to allocate paging resources and generate the second page in accordance with a second level of quality of service determined based on the same paging information received by the second paging requirements determination module. However, the examiner maintains that the feature(s) means for receiving a second page, different from the first page, from a second access node comprising a second paging resource control module and a first paging requirements determination module, where the second paging resource control module is configured to allocate paging resources and generate the second page in accordance with a second level of quality of service determined based on the same paging information received by the second paging requirements determination module was well known in the art, as taught by Miah.

In the same field of endeavor, Miah discloses the feature(s) means for receiving a second page, different from the first page, from a second access node (e.g., radio access network with RNC 12, node B 16, and transmitter/receiver 20) comprising a second paging resource control module and a first paging requirements determination module, where the second paging resource control module is configured to allocate paging resources and generate the second page in accordance with a second level of quality of service (e.g., an indicator of type or priority) determined based on the same paging information received by

the second paging requirements determination module { (see col. 1, [0007]; col. 2, [0012 or lines 53-57]; col. 3, [0016 or lines 10-16]; Fig. 1), where the radio access network reads the header (e.g., an indicator of type or priority) of a paging message to schedule or prioritize for transmitting to a mobile phone (2). As further support, Miah at the least further discloses the feature(s) an end node (e.g., mobile phone 2) for use in a system for distributed packet-based paging (see col. 1, [0007]; col. 2, [0015] - col. 3, [0017]), where the mobile station (2) is sent a paging message via a the first access node (e.g., radio access network with RNC 12, node B 16, and transmitter/receiver 20) and the second access node (e.g., radio access network with RNC 14, node B 18, and transmitter/receiver 22). }.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Sanmugam and Miah to have the feature(s) means for receiving a second page, different from the first page, from a second access node comprising a second paging resource control module and a first paging requirements determination module, where the second paging resource control module is configured to allocate paging resources and generate the second page in accordance with a second level of quality of service determined based on the same paging information received by the second paging requirements determination module, in order to provide an improved RNC for scheduling or prioritizing paging messages, as taught by Miah (see col. 2, [0011; 0012 or lines 14-18]).

Regarding **claims 109, 110, 111, and 112**, Sanmugam discloses the access node of claim 59, wherein the access node (e.g., BS 256) is configured to exchange paging information with a second access node in the system for distributed packet-based paging, the

plurality of access nodes serving a plurality of end nodes (e.g., mobile station M1), and to serve at least end node (see col. 4, line 56 - col. 5, line 45; Figs. 1 & 9), and

wherein the paging requirements determination module is further configured to determine the level of quality of service (QoS) (e.g., class of service or priority) at least in part (i) from analyzing at least one of a header field or a payload field, using a packet classification technique (e.g., class of service or priority), from a data message (e.g., page requests) received and (ii) from stored information uniquely associated with the access node (e.g., BS 256) in which the paging requirements determination module resides { (see col. 5, lines 40-45; col. 4, line 66 - col. 5, line 13; col. 13, lines 1-32; col. 7, lines 8-15; col. 8, line 1-9; col. 9, line 2; Figs. 9, 1, 8A-B), where page requests are based on paging information such as class of service, paging parameters, paging field, paging characteristics, and paging extent in which a header field would be implicit due to paging information of the paging requests as evidenced by the fact that one of ordinary skill in the art would clearly recognize. In addition, paging orders are transmitted towards the base station (e.g., 256) and places the page message(s) in buffers of the base stations in which the page message(s) are transmitted according to paging priorities (see col. 12, lines 29-40), where the base station (e.g., 256) determines what the paging priorities are in order to allocate resources to distribute the paging messages appropriately. }. Sanmugam inexplicitly discloses having the feature(s) at least one of a header field or a payload field. However, the examiner maintains that the feature(s) at least one of a header field or a payload field was well known in the art, as taught by Miah.

In the same field of endeavor, Miah discloses the feature(s) at least one of a header field or a payload field (see col. 2, [0012]; Fig. 1), where the radio access network reads the header (e.g., an indicator of type or priority) of a paging message to schedule or prioritize for transmitting to a mobile phone (2). As further support, Miah at the least discloses the feature(s) level of quality of service (e.g., an indicator of type or priority) (see col. [0012 or lines 12-23]), where communication is provided by a packet radio system exchanging data or paging signals and the radio access network reads the header (e.g., an indicator of type or priority) of a paging message to schedule or prioritize for transmitting to a mobile phone (2).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Sanmugam and Miah to have the feature(s) at least one of a header field or a payload field, in order to provide an improved RNC for scheduling or prioritizing paging messages, as taught by Miah (see col. 2, [0011; [0012 or lines 14-18]).

Regarding **claims 113 and 116**, the combination of Sanmugam and Miah discloses every limitation claimed, as applied above (see claim 103), in addition Sanmugam further discloses wherein the first access node (e.g., BS 256) and the second access node (e.g., BS 256) are each configured to exchange paging information corresponding to the first page and the second page { (see col. 4, line 56 - col. 5, line 45; col. 14, lines 40-51; Figs. 1 & 9), where a mobile station can receive a message in a second cell (e.g., 256) after being hand-off to another cell (e.g., 256) (see col. 5, lines 19-27,51-57; col. 13, lines 43-50; col. 6, lines 21-25) }.

Regarding **claims 114 and 117**, Sanmugam discloses the end node of claim 113 wherein each of the first and second paging requirements determination module (e.g., BS 256) is configured to determine paging requirements to send to the first and second paging resource control module, respectively, currently in communication with an intended end node of the first and second page, the respectively, the paging requirements being derived at least in part (i) from analyzing at least one of a header field or a payload field, using a packet classification technique (e.g., class of service or priority), from a data message (e.g., page requests) received and (ii) from stored information uniquely associated with the first or second access node (e.g., BS 256), respectively, in which the paging requirements determination module resides { (see col. 5, lines 40-45; col. 4, line 66 - col. 5, line 13; col. 13, lines 1-32; col. 7, lines 8-15; col. 8, line 1-9; col. 9, line 2; Figs. 9, 1, 8A-B), where page requests are based on paging information such as class of service, paging parameters, paging field, paging characteristics, and paging extent in which a header field would be implicit due to paging information of the paging requests as evidenced by the fact that one of ordinary skill in the art would clearly recognize. In addition, paging orders are transmitted towards the base station (e.g., 256) and places the page message(s) in buffers of the base stations in which the page message(s) are transmitted according to paging priorities (see col. 12, lines 29-40), where the base station (e.g., 256) determines what the paging priorities are in order to allocate resources to distribute the paging messages appropriately. }. Sanmugam inexplicitly discloses having the feature(s) at least one of a header field or a payload field. However, the examiner maintains that the feature(s) at least one of a header field or a payload field was well known in the art, as taught by Miah.

In the same field of endeavor, Miah discloses the feature(s) at least one of a header field or a payload field (see col. 2, [0012]; Fig. 1), where the radio access network reads the header (e.g., an indicator of type or priority) of a paging message to schedule or prioritize for transmitting to a mobile phone (2).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Sanmugam and Miah to have the feature(s) at least one of a header field or a payload field, in order to provide an improved RNC for scheduling or prioritizing paging messages, as taught by Miah (see col. 2, [0011; [0012 or lines 14-18]).

Regarding **claims 115 and 118**, the combination of Sanmugam and Miah discloses every limitation claimed, as applied above (see claim 114), in addition Sanmugam further discloses wherein each respective paging resource control module is configured to provide paging resource control functionality in accordance with the paging requirements received from the paging requirements determination module, where the paging resource control functionality includes controlling at least one of (i) paging resources, (ii) paging operations, or (iii) the generation of pages to the respective an intended end node (see col. 5, lines 40-45; col. 10, lines 53-56; col. 13, lines 1-32; col. 7, lines 8-15; col. 8, line 1-9; Figs. 9, 1, 8A-B), where a base station provides allocates resources to a mobile station (M1) (see col. 4, line 64 - col. 5, line 13) and where paging orders are transmitted towards the base station (e.g., 256) and places the page message(s) in buffers of the base stations in which the page message(s) are transmitted according to paging priorities (see col. 12, lines 29-40; col. 8, line 45 - col. 9,

line 4), where the base station (e.g., 256) determines what the paging priorities are in order to allocate resources to distribute the paging messages appropriately.

Claims 60, 71, 82, 93, and 105 are rejected under 35 U.S.C. 103(a) as being unpatentable over **Sanmugam** (US 5,533,094) in view of **Miah et al.** (hereinafter Miah) (EP 1217855 A1) as applied to claims 59, 70, 81, and 92 above, and further in view of **Palat et al.** (hereinafter Palat) (US 6,765,890 B1).

Regarding **claims 60, 71, 82, 93, and 105**, Sanmugam discloses the access node of claim 59, wherein the paging requirements determination module further comprises:

a monitoring agent module that determines when to initiate a page to the intended end node (see col. 12, lines 15-28);

a tracking agent module that tracks the location of end nodes based on received location update signals (see col. 7, lines 23-36); and

an anchor paging agent module that coordinates (e.g., priority or order) page request signaling to the intended node (see col. 8, lines 5-9, 24-25). The combination of Sanmugam and Miah inexplicitly discloses having the feature(s) received location update signals.

However, the examiner maintains that the feature(s) received location update signals was well known in the art, as taught by Palat.

In the same field of endeavor, Palat discloses the feature(s) received location update signals (see col. 4, lines 11-19; col. 5, lines 17-26; col. 6, lines 4-20, 44-51).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Sanmugam, Miah, and Palat to have the

feature(s) received location update signals, in order to provide an implementation that performs a routing area update as a mobile terminal moves between radio access system coverage areas, as taught by Palat (see col. 2, lines 11-15).

Claims 61, 72, 83, and 94 are rejected under 35 U.S.C. 103(a) as being unpatentable over **Sanmugam (US 5,533,094)** in view of **Miah et al.** (hereinafter Miah) (**EP 1217855 A1**) as applied to claims 59, 70, 81, and 92 above, and further supported by **Wallentin et al.** (hereinafter Wallentin) (**US 6,834,191 B2**).

Regarding **claims 61, 72, 83, and 94**, Sanmugam discloses the access node of claim 59, wherein the paging resource control module further comprises:

a local paging agent module configured to coordinate signaling between the paging requirements determination module and other access nodes (see col. 5, lines 19-27; col. 5, line 65 - col. 6, line 5; col. 6, lines 17-43; Figs. 1-2 & 9), where the system pages surrounding location areas. Sanmugam inexplicitly discloses having the feature(s) signaling between the paging requirements determination module and other access nodes. However, the examiner maintains that the feature(s) signaling between the paging requirements determination module and other access nodes was well known in the art, as taught by Miah.

In the same field of endeavor, Miah discloses the feature(s) signaling between the paging requirements determination module and other access nodes (see col. 1, [0005]; col. 2, [0012, 0015/lines 53-57]), where the RNC (12, 14) are interlinked to communicate.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Sanmugam and Miah to have the

feature(s) signaling between the PRD module and other access nodes, in order to provide an improved RNC for scheduling or prioritizing paging messages, as taught by Miah (see col. 2, [0011; 0012 or lines 14-18]). The combination of Sanmugam and Miah clearly discloses the feature(s) indicated above as evidenced by the fact that one of ordinary skill in the art would clearly recognize. However, the examiner maintains that the feature(s) a local paging agent module that coordinates signaling between the PRD module and other access nodes was well known in the art, as taught by Wallentin.

As further support in the same field of endeavor, Wallentin discloses the feature(s) a local paging agent module that coordinates signaling between the PRD module and other access nodes (see col. 7, lines 19-23; col. 13, lines 17-31; Figs. 1-2).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Sanmugam and Miah as further supported by Wallentin to have the feature(s) a local paging agent module that coordinates signaling between the PRD module and other access nodes, in order to provide a technique for paging a mobile station in a multicell area, as taught by Wallentin (see col. 4, lines 24-27).

Claims 65, 76, 87, 98, and 107 are rejected under 35 U.S.C. 103(a) as being unpatentable over **Sanmugam** (US 5,533,094) in view of **Miah et al.** (hereinafter Miah) (EP 1217855 A1) as applied to claim 109, 110, 111, 112, and 115 above, and further in view of **Laroia et al.** (hereinafter Laroia) (US 6,823,191 B2).

Regarding **claims 65, 76, 87, 98, and 107**, Sanmugam discloses the access node of claim 64, wherein the QoS comprises a page transmission timing constraint (see col. 10, lines 4-6; col. 12, lines 12-18,31-40; Fig. 8B 'ref. 212'), where a paging attempt has a priority for waiting time in a buffer. Sanmugam does not specifically disclose having the feature(s) wherein the page transmission timing constraint indicates paging latency information and specifies an upper bound on paging delay. However, the examiner maintains that the feature(s) wherein the page transmission timing constraint indicates paging latency information and specifies an upper bound on paging delay was well known in the art, as taught by Laroia.

In the same field of endeavor, Laroia discloses the feature(s) wherein the page transmission timing constraint indicates paging latency information and specifies an upper bound on paging delay (see col. 3, line 38 - col. 4, lines 8).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Sanmugam, Miah, and Laroia to have the feature(s) wherein the page transmission timing constraint indicates paging latency information and specifies an upper bound on paging delay, in order to have latency significantly reduced in a base station transmitting a paging message to a wireless terminal receiving a paging message, as taught by Laroia (see col. 2, lines 33-36).

Claims 69, 80, 91, and 102 are rejected under 35 U.S.C. 103(a) as being unpatentable over **Sanmugam (US 5,533,094)** in view of **Miah et al.** (hereinafter Miah) (**EP 1217855 A1**) as applied to claim 109, 110, 111, and 112 above, and further in view of **Weber et al.** (hereinafter Weber) (**US 6,314,282 B1**).

Regarding **claims 69, 80, 91, and 102**, the combination of Sanmugam and Miah discloses every limitation claimed as applied above in claim 59. The combination of Sanmugam and Miah does not specifically disclose having the feature(s) wherein the determined level of quality of service comprises information indicating a state of device operation in which an end node to which the page is directed is to operate after receiving the page. However, the examiner maintains that the feature(s) wherein the determined level of quality of service comprises information indicating a state of device operation in which an end node to which the page is directed is to operate after receiving the page was well known in the art, as taught by Weber.

In the same field of endeavor, Weber discloses the feature(s) wherein the determined level of quality of service comprises comprise information indicating a state of device operation in which a mobile terminal (7) which reads on the claimed “end node” to which the page is directed is to operate after receiving the page (see col. 5, lines 40-49,3-22; col. 6, lines 13-20; Figs. 3, 5).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Sanmugam, Miah, and Weber to have the feature(s) wherein the determined level of quality of service comprises comprise information indicating a state of device operation in which an end node to which the page is

directed is to operate after receiving the page, in order to provide mode change information that will automatically change the mode of a mobile terminal, as taught by Weber (see col. 2, lines 9-13, 65-67).

Claim 119 is rejected under 35 U.S.C. 103(a) as being unpatentable over **Sanmugam (US 5,533,094)** in view of **Miah et al.** (hereinafter Miah) (**EP 1217855 A1**) as applied to claim 70 above, and further in view of **Melpignano et al.** (hereinafter Melpignano) (**US 7,193,991 B2**).

Regarding **claim 119**, the combination of Sanmugam and Miah discloses every limitation claimed as applied above in claim 70. The combination of Sanmugam and Miah does not specifically disclose having the feature(s) delivering paging information directly from an originating access node to intended destination access nodes using one of Internet Protocol (IP) unicast or multicast addressing and delivery mechanisms. However, the examiner maintains that the feature(s) delivering paging information directly from an originating access node to intended destination access nodes using one of Internet Protocol (IP) unicast or multicast addressing and delivery mechanisms was well known in the art, as taught by Melpignano.

In the same field of endeavor, Melpignano discloses the feature(s) delivering paging information directly from an originating access node to intended destination access nodes using one of Internet Protocol (IP) unicast or multicast addressing and delivery mechanisms { (see col. 12, lines 36-42; col. 14, lines 21-27) }.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Sanmugam, Miah, and Melpignano to have the feature(s) delivering paging information directly from an originating access node to intended destination access nodes using one of Internet Protocol (IP) unicast or multicast addressing and delivery mechanisms, in order to provide an improved radio communications arrangement, as taught by Melpignano (see col. 2, lines 18-26).

Response to Arguments

5. Applicant's arguments with respect to claims 109-114, 116-117, and 119 have been considered but are moot in view of the new ground(s) of rejection necessitated by the amended language, new limitations, and/or new claims.

In response to applicant's arguments, the Examiner respectfully disagrees as the applied reference(s) provide more than adequate support and to further clarify (see the above claims for relevant citations and comments in this section).

6. In response to applicant's arguments against the references individually, one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986).

Regarding applicant's argument of claim 70 in the par. bridging pgs. 14-15, "...determining a level of quality of service for a paging message by receiving and analyzing paging information at a paging requirements module within an access; and allocating paging resources and generating the paging message from a paging resource control module within the access node in accordance with the level of quality of service determined by the paging requirements determination module...", the Examiner respectfully disagrees. Applicant has failed to interpret and appreciate the combined teachings of well-known prior art Sanmugam and Miah that clearly discloses the claimed feature(s) as would be clearly recognized by one of ordinary skill in the art. In particular, Sanmugam discloses the language as related to the claimed feature(s)

wherein the paging requirements determination module is configured to receive and analyze paging information to determine a level of quality of service (e.g., class of service or priority) for a corresponding paging message (e.g., page requests) { (see col. 5, lines 40-45; col. 4, line 66 - col. 5, line 13; col. 13, lines 1-32; col. 7, lines 8-15; col. 8, line 1-9; col. 9, line 2; Figs. 9, 1, 8A-B), where page requests are based on paging information such as class of service, paging parameters, paging field, paging characteristics, and paging extent. In addition, paging orders are transmitted towards the base station (e.g., 256) and places the page message(s) in buffers of the base stations in which the page message(s) are transmitted according to paging priorities (see col. 12, lines 29-40), where the base station (e.g., 256) determines what the paging priorities are in order to allocate resources to distribute the paging messages appropriately. },

wherein the paging resource control module is configured to allocate paging resources and generate the corresponding paging message in accordance with the level of quality of service (e.g., class of service or priority) determined by the paging requirements determination module { (see col. 5, lines 40-45; col. 10, lines 53-56; col. 13, lines 1-32; col. 7, lines 8-15; col. 8, line 1-9; Figs. 9, 1, 8A-B), where a base station provides allocates resources to a mobile station (M1) (see col. 4, line 64 - col. 5, line 13) and where paging orders are transmitted towards the base station (e.g., 256) and places the page message(s) in buffers of the base stations in which the page message(s) are transmitted according to paging priorities (see col. 12, lines 29-40; col. 8, line 45 - col. 9, line 4), where the base station (e.g., 256) determines what the paging priorities are in order to allocate resources to distribute the

paging messages appropriately }. As further support in the same field of endeavor, Miah discloses the language as related to the claimed feature(s)

level of quality of service (e.g., an indicator of type or priority) (see col. [0012 or lines 12-23]), where communication is provided by a packet radio system exchanging data or paging signals and the radio access network reads the header (e.g., an indicator of type or priority) of a paging message to schedule or prioritize for transmitting to a mobile phone (2). In addition, Miah at the least further the feature(s) discloses a system for distributed packet-based paging, comprising: a plurality of access nodes (e.g., radio access network with RNC 12, node B 16, and transmitter/receiver 20) configured to exchange paging messages (see col. 1, [0007]; col. 2, [0015] - col. 3, [0017]), where the mobile station (2) is sent a paging message. }. Therefore, the combination(s) of the reference(s) Sanmugam and Miah as addressed above more than adequately meets the claim limitations.

7. Regarding applicant's argument(s) of claims **58-63, 65-69, 71-74, 76-85, 87-96, 98-105, 107-108, 115, and 118**, the claims are addressed for the same reasons as set forth above and as applied above in each claim rejection.

Conclusion

8. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
- a. Bender et al. (US 6,961,329 B1) discloses a method and apparatus for forwarding messages among multiple radio networks. Bender at the least further discloses ...unsolicited CDMA message (e.g., paging request messages) are sent by the MSC to

the CDMA radio network (see Bender - col. 8, lines 11-13). In addition, Bender further discloses ...unsolicited CDMA messages are thus sent...and can be sent by...the CDMA BSC to the HDR BSC with which the access terminal has tuned (see Bender - col. 8, lines 23-26).

9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to WILLIE J. DANIEL JR whose telephone number is (571)272-7907. The examiner can normally be reached on 8:30-4:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Charles Appiah can be reached on (571) 272-7904. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only.
